

PUMP CATALOGUE

SC-, VS- AND NC-PUMPS
WITH INTEGRATED FREQUENCY CONVERTER

Kolmeks is a Finnish manufacturing company and part of the family-owned Brandt Group Oy Ltd. The group has factories in Finland, Estonia, China and India, providing customers with expertise in two business areas: pumps and components (production and supply chain solutions). Kolmeks Pumps specializes in state-of-the-art pumps, HVAC products and dedicated maintenance services.

The pump specialist

We have been engineering pumps for over 75 years and striving to develop a portfolio of state-of-the-art pumping equipment. Pump technology and application know-how are our core competencies. We provide our customers with high-quality pumping and HVAC solutions as well as versatile maintenance services.

The main industries we work with

include building services, industrial, marine and mobility operators. Kolmeks pumps are typically used in the pulp, paper and chemical industries as well as in other process industries.

Now and in the future, the human infrastructure depends on pumps that improve the quality of lives through sustainable means.

Planet, people and continuity are the cornerstones of our sustainability strategy.

The pumps and their motors are designed and manufactured with the highest craftsmanship and they meet the demands of the European EcoDesign directive. Kolmeks was also among the first Finnish companies to receive the ISO 9001 Quality certificate and the ISO 14001 Environmental certificate.

We strive to be a solutions provider helping our customers to succeed by offering the most efficient, reliable and sustainable products and services.

Kolmeks pumps are available in four different materials; grey cast iron, nodular cast iron, bronze and stainless steel casting. The pumps are also available with several different shaft sealing solutions – which makes them suitable for numerous pumping applications.

Global reach, local presence

We have been operating in the Finnish pump market since 1945. Today, a large part of the pumps we manufacture are delivered, to all major European countries, Russia and China. Increasingly, Kolmeks products are also exported to several countries in the Middle East, Asia and Africa.

Turenki and Chuzhou are key sites for Kolmeks's own pumps manufacturing and motor assembly.

Ask us more about our products and services! We will be more than happy to provide you with solutions.

www.kolmeks.com

Pump ranges

Kolmeks has three ranges of pumps with integrated frequency control; the SC-, VS- and NC -ranges. The smallest pump with integrated frequency control is 0,08 kW, the largest 45 kW. In addition, all of the pumps are suited for control by external frequency control.

General technical data

AEP, LP and ALP pumps are bronze domestic hot water pumps equipped with an integrated frequency converter according to the SCA (1x230V) – and VSA (3x400V) –version.

Other versions are also available if needed, see Frequency converter pumps SC series in this product catalogue.

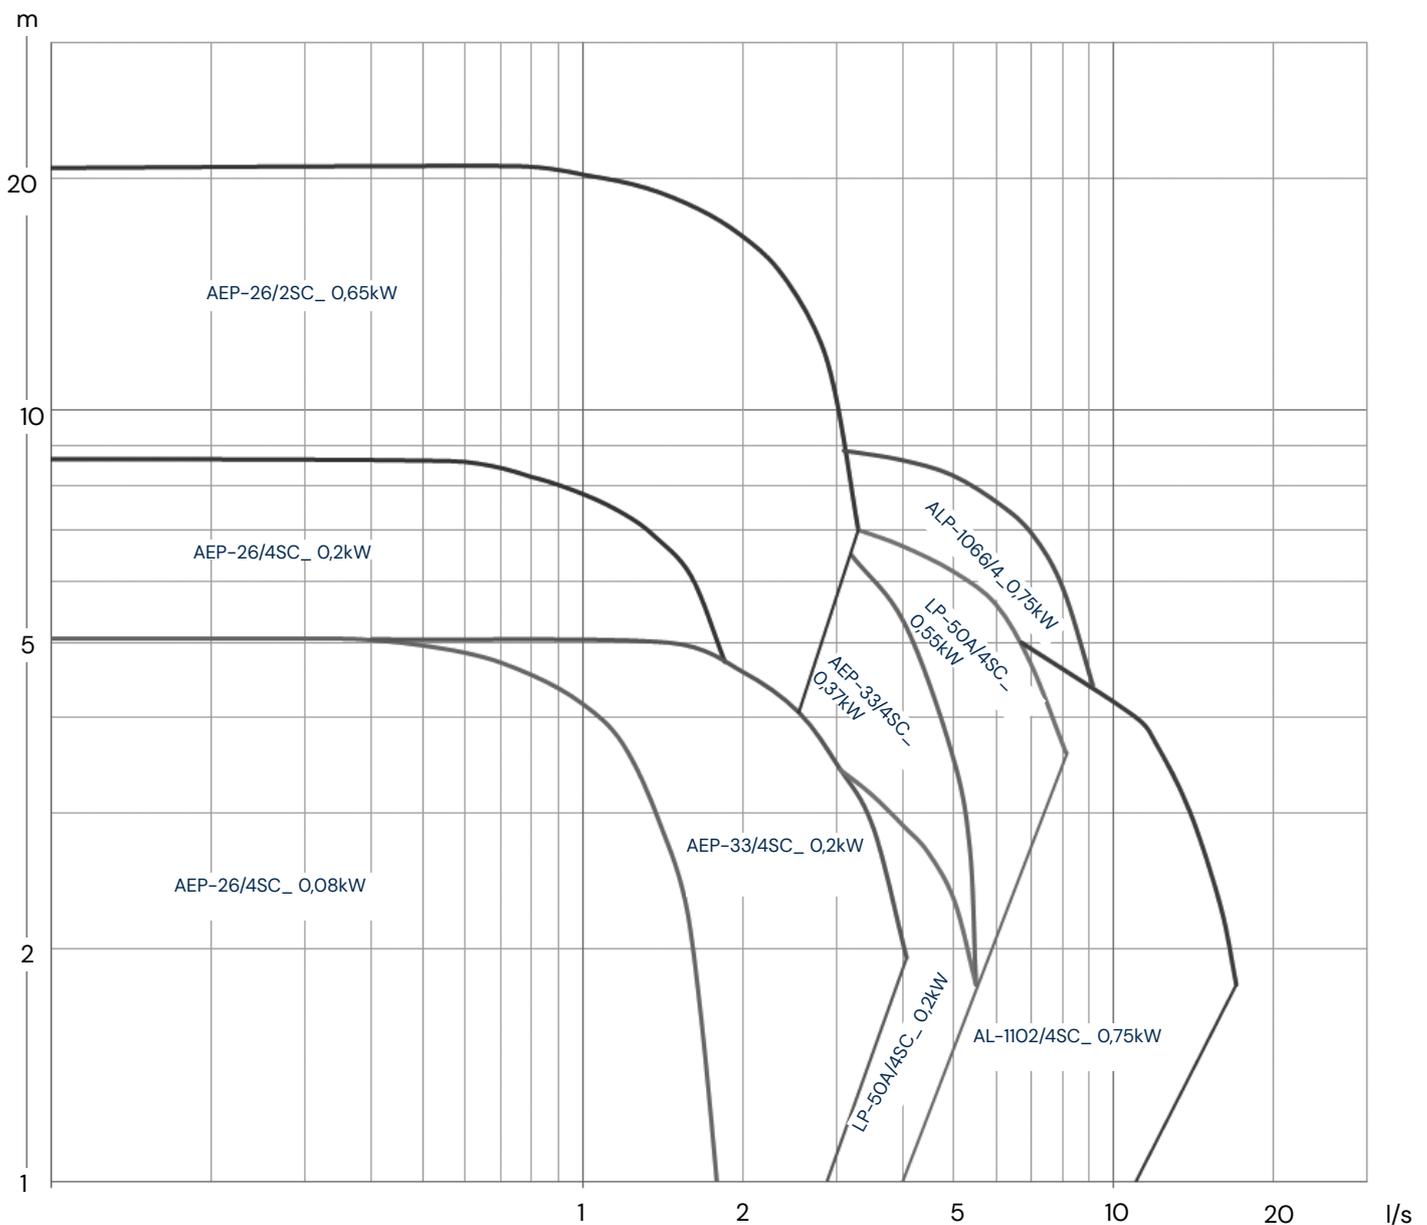

- AEP pumps are equipped with threads G1 – G1 1/4
- LP and ALP pumps are equipped flanges DN50 ... DN100

Applications

These bronze pumps are mainly used for the circulation of domestic hot water and seawater. They can also be used in standard circulation systems, as pressure boosters and as transfer pumps for various clean oxygen-rich liquids.

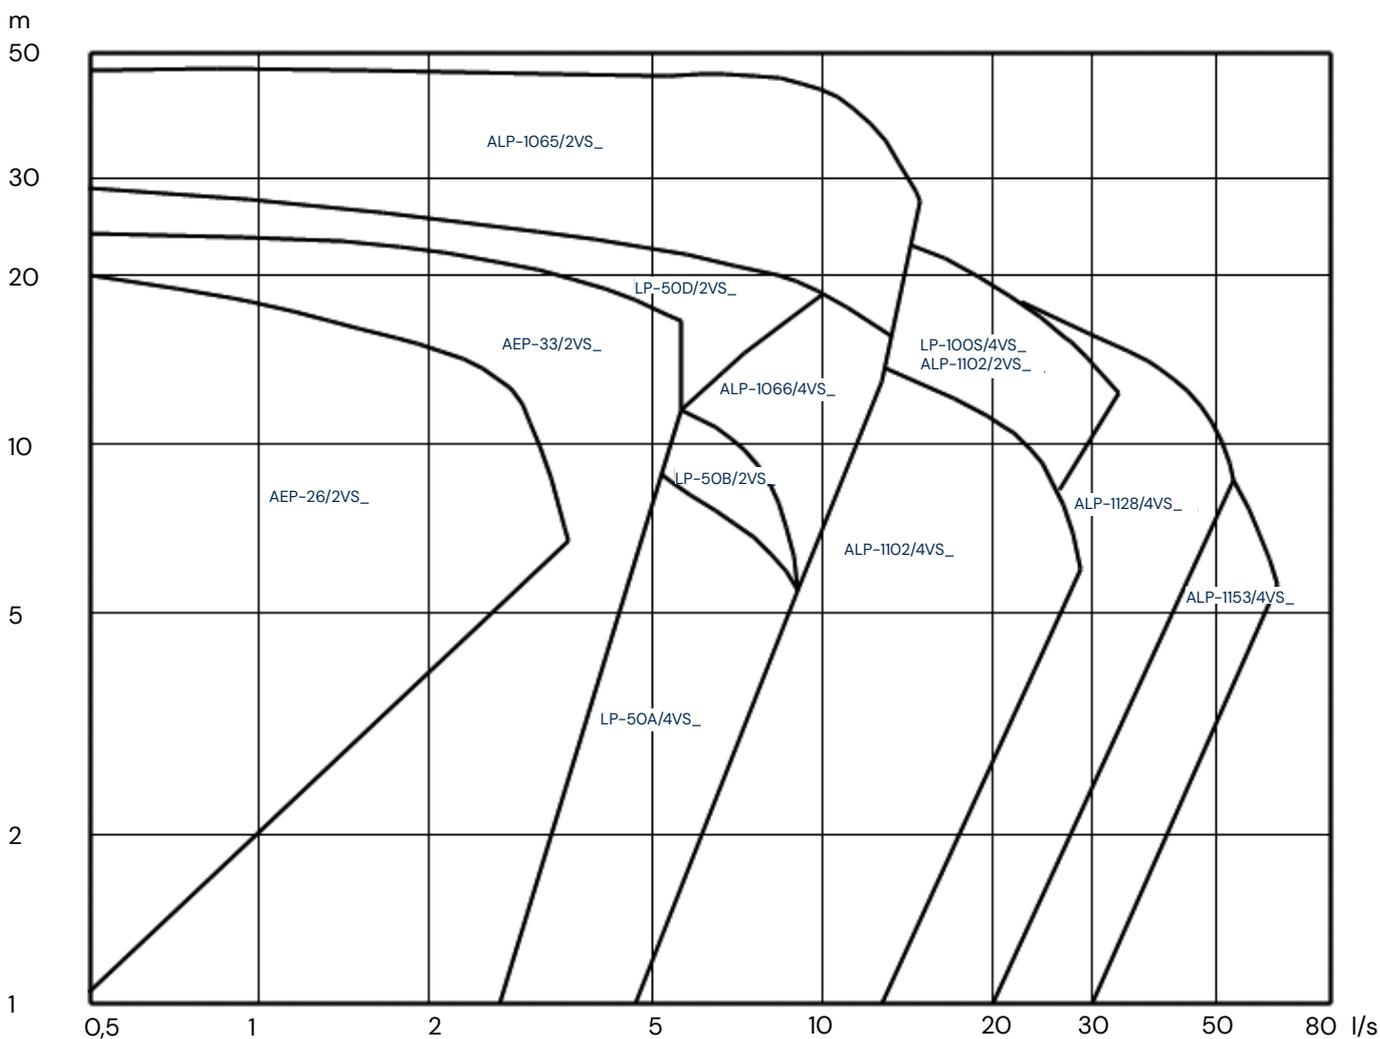

Quick selection chart SC-pumps

Quick selection chart VS-pumps

Supply voltage 3x400V.

Structure

Pump

SC_- and VS domestic hot water pumps are monoblock centrifugal pumps equipped with a dry motor, which fulfill the requirements of EcoDesign –directive. The impeller is installed directly onto the shaft of the electric motor (no separate couplings). A frequency converter is integrated into the pump motor.

Electric motor

The electric motor is a three-phase Kolmeks asynchronous motor designed specifically for pump use and frequency converter operation, which guarantees high starting torque and low energy consumption and fulfills the requirements of EcoDesign –directive. The electric motor is highly efficient and has low noise levels.

Supply voltage:	SC: 1 x 230 V, 50 Hz VS: 3 x 400V, 50Hz

Kolmeks recommendation for pumps in district heating circulation systems

SCA- and VSA-version bronze domestic hot water pump equipped with an integrated frequency converter.

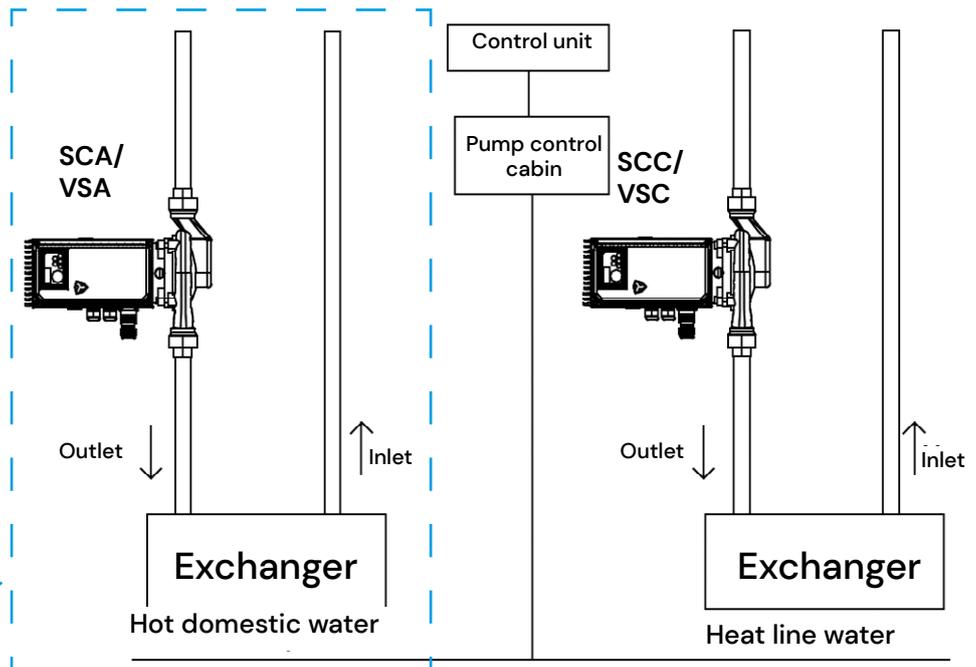

SC –series supply voltage 1 x 230 V

VS –series supply voltage 3 x 400 V

Advantages of SC- and VS –pump

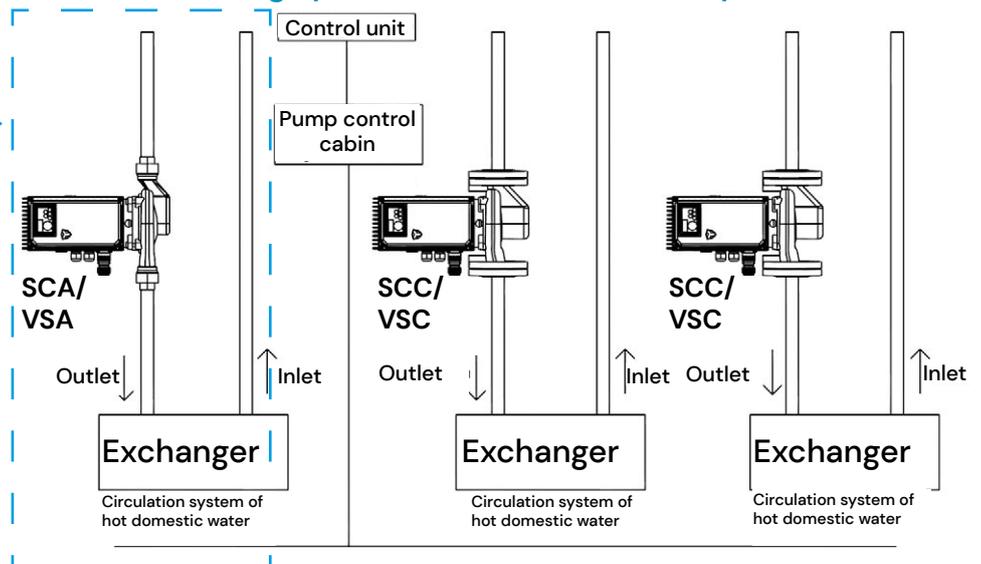

- Alarms to BMS
- Duty point can be adjusted in one step
- Automatically adapts to system heat/cooling requirements (radiator and air heating circulation)
- Energy savings
- Reliable operation
- Reduced wear in pipework and system valves leading to prolonged life
- Smoother system operation
- Replacement motor unit service

Pump adjustment method SCA, SCB, SCC, SCD, SCF, SCG, SCM / VSA, VSB, VSC, VSD, VSF, VSG, VSM

Installation

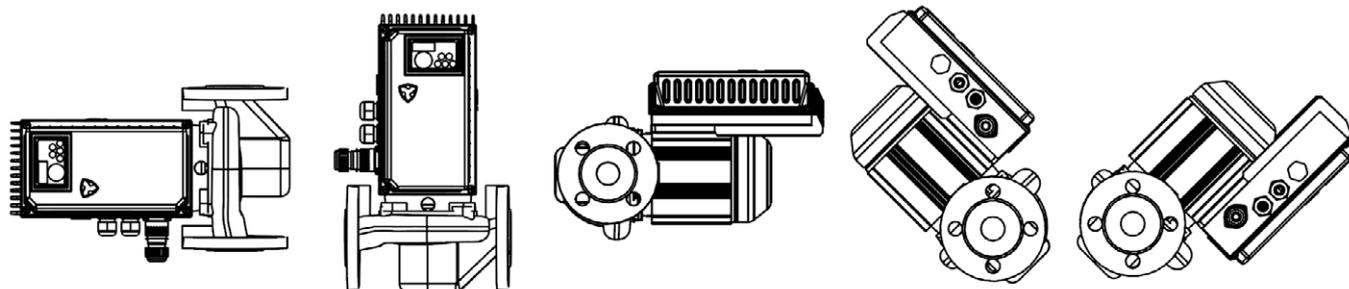

The pump can be installed directly in the pipework without additional support. The pumps with flanges include the base plate.

The position of the motor unit and therefore the location of the frequency converter box can be changed by detaching the motor unit from the pump housing and rotating it to the required position, with certain limitations.

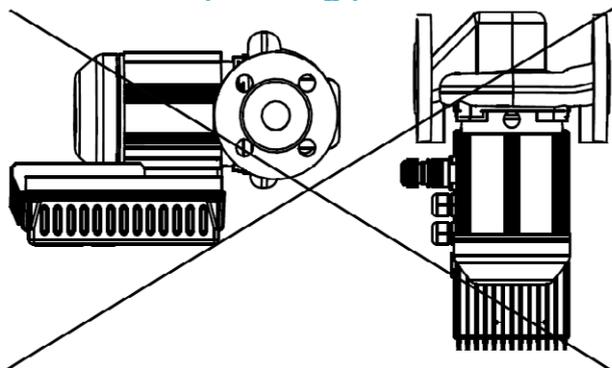

Ensure the following when installing the pump

- Enough room for control, service and inspections
- The installation position should be chosen such that the display is readable; a separate control panel can also be used if required.
- Possibility to use lifting and transfer devices if needed
- Shut-off valves on both sides of the pump
- Pump must be installed in such a position that the integrated frequency converter is not in the immediate vicinity of a hot pipes and is fully accessible.

Operating positions

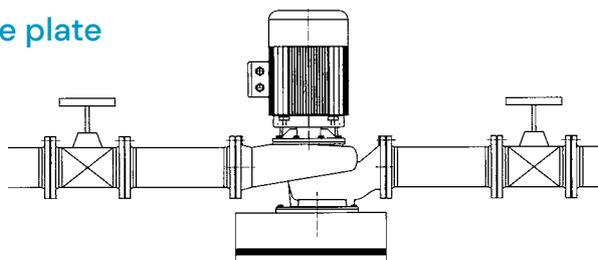

Prohibited operating positions

Recommended general limits without the base plate

Size	Power
DN 15 ... 50	max. 2,2 kW
DN 65	4 kW
DN 80	4 kW
DN 100	7,5 kW
DN 125	7,5 kW

Large pumps are fastened by their base plate onto a freely moving concrete plinth, which is to be separated from the floor by a 20-mm thick rubber or cork mat. The weight of the concrete base must be about 1.5 times the weight of the pump.

SCA / VSA pump: Direct speed reference using a potentiometer

Applications

For systems with no continuous automatic adjustment requirement and a constant duty point, such as domestic hot water circulation systems, for example.

Accessories

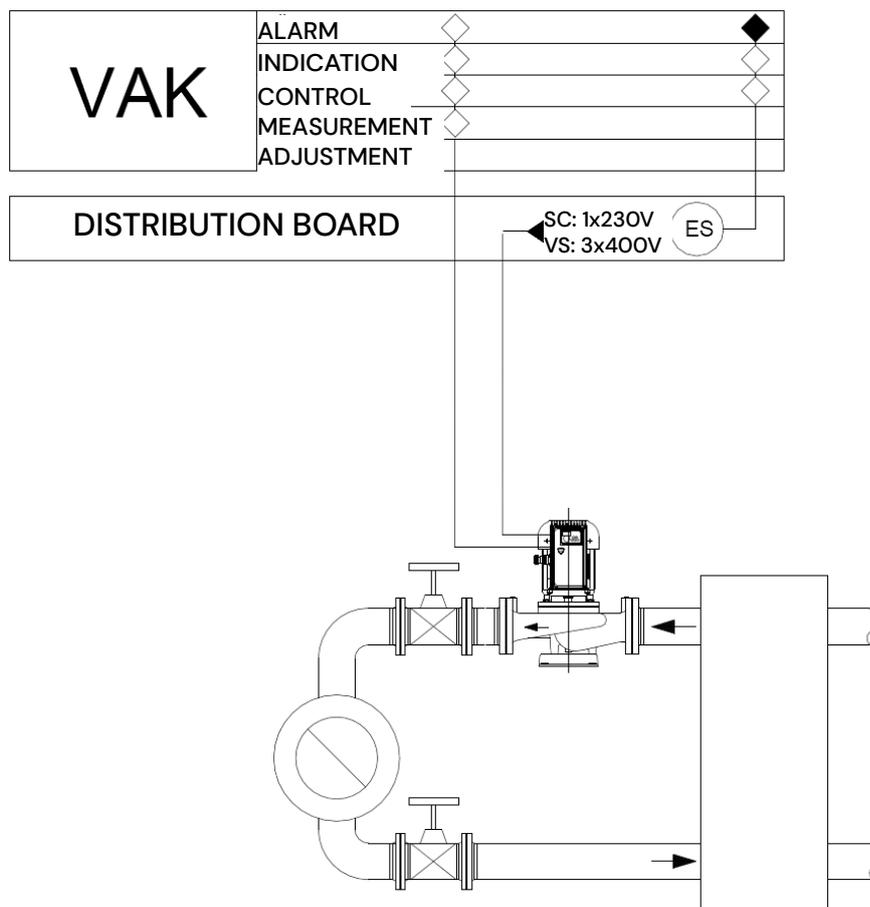

Pump and frequency converter.

Operating principle

The rotation speed of the pump is set in one step during commissioning using the buttons on the frequency converter.

Pump curve

The pump QH curve equals the QH curve of a standard speed pump.

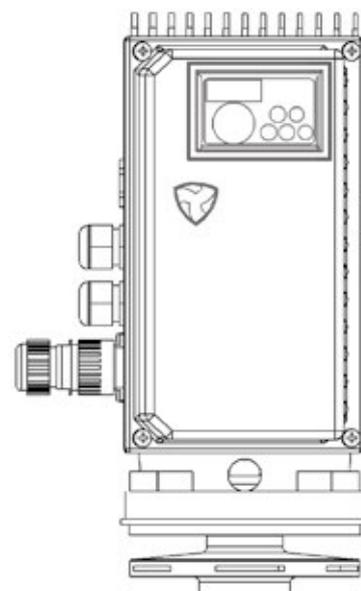

Drive unit

Exchange unit (SCA, VSA)

The pump motor unit without the transmitter includes an electric motor, a frequency converter, a sealing flange, an impeller, and seals. When replacing the exchange unit, no procedures need to be carried out on the piping or electricity, because there is no need to detach the pump housing and the power supply is connected using a quick connection plug.

SCA –pumps are equipped with quick connecting plug in mains supply.

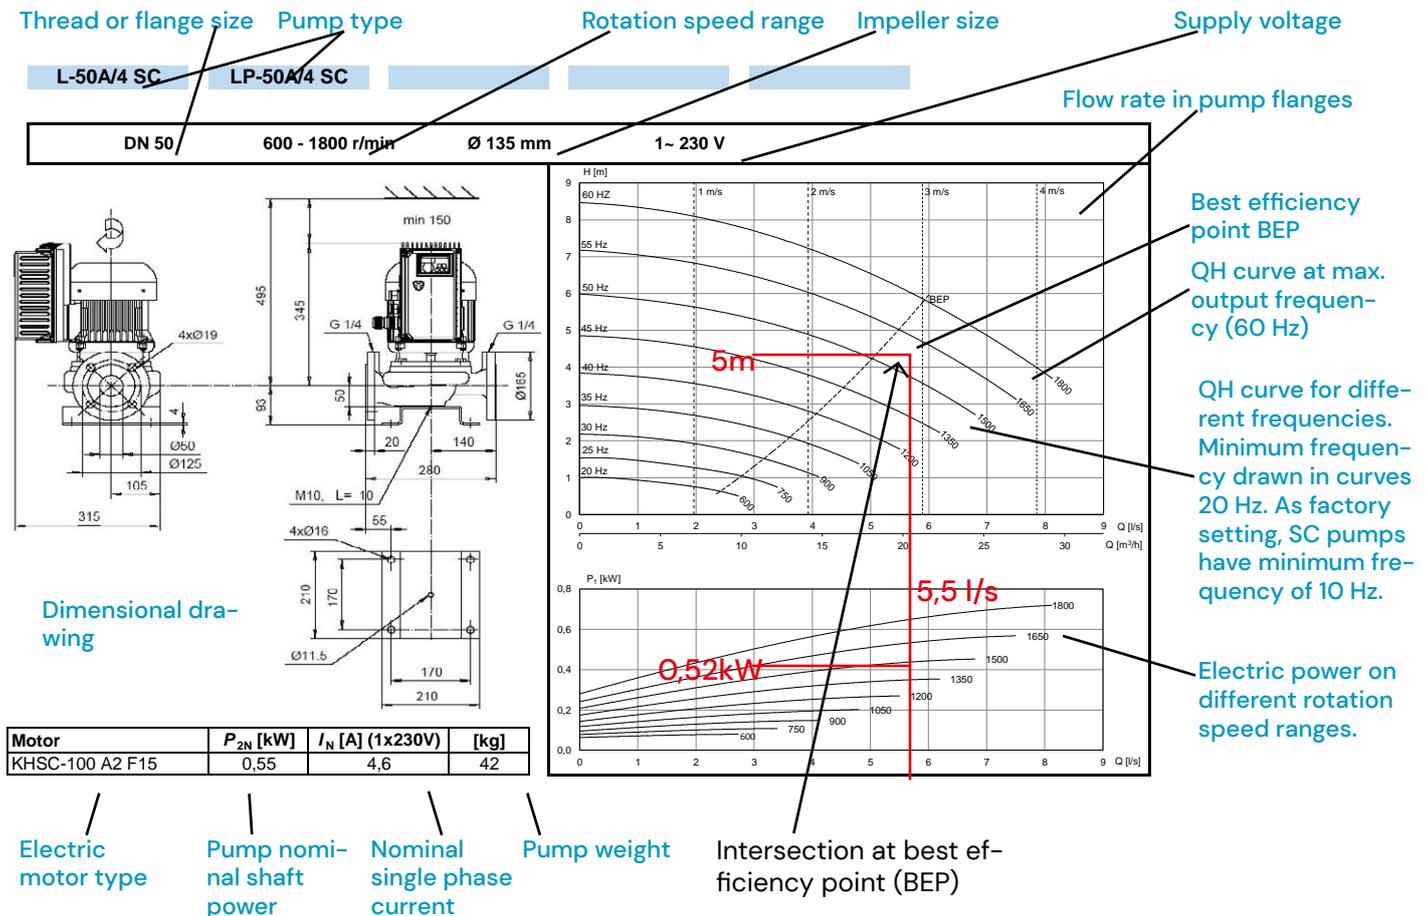

In VS –pumps the mains supply is fixed.

Reading curves

Characteristic curves apply to +20°C water.

NOTE! Liquid density and viscosity affect the amount of power required. Please check that the motor power is sufficient for liquids with a higher density and viscosity than water. Please contact Kolmeks for further information.

An example of selecting a pump:

Duty point 5.5 l/s, 50kPa (5m)

1. Find a pump size with a BEP (best efficiency point) which is as close as possible to the required duty point.
2. Ensure that the output 5.5 l/s and head 5m intersect at the best efficiency point.
3. The best energy efficiency and lowest energy consumption are obtained by following the above steps.
4. If needed, it is possible to read the input power of the device on the P1 curve. In this case, the input power is 0.52 kW at the desired duty point.

TECHNICAL INFORMATION

CIRCULATING PUMPS TO THE HEATING AND COOLING SYSTEMS, INLINE

INLINE PUMPS WITH INTEGRATED SC FREQUENCY
CONVERTER, 1X230V

INLINE PUMPS WITH INTEGRATED VS FREQUENCY
CONVERTER, 3X400V

General technical data

SC- and VS-series of Kolmeks circulation pumps and variable speed controlled centrifugal pumps with integrated frequency converter.

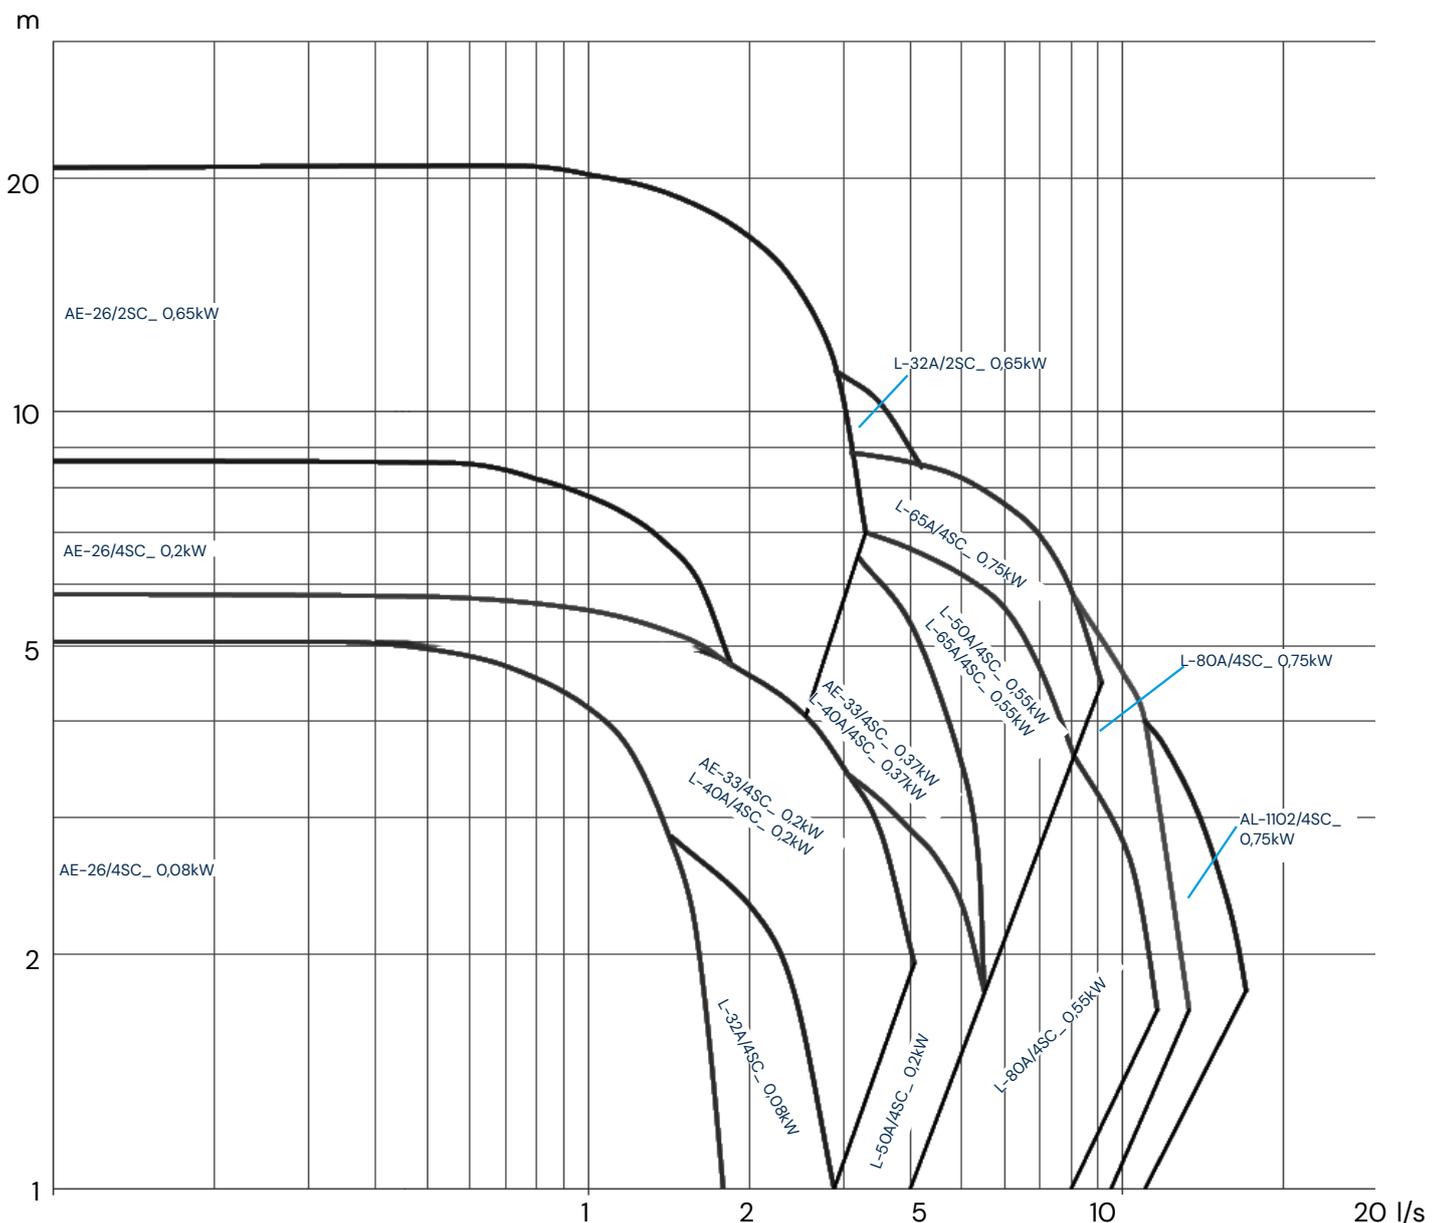

Applications

Cast iron SC- and VS series pumps can be used as circulation, pressure boosting and transfer pumps for clean liquids.

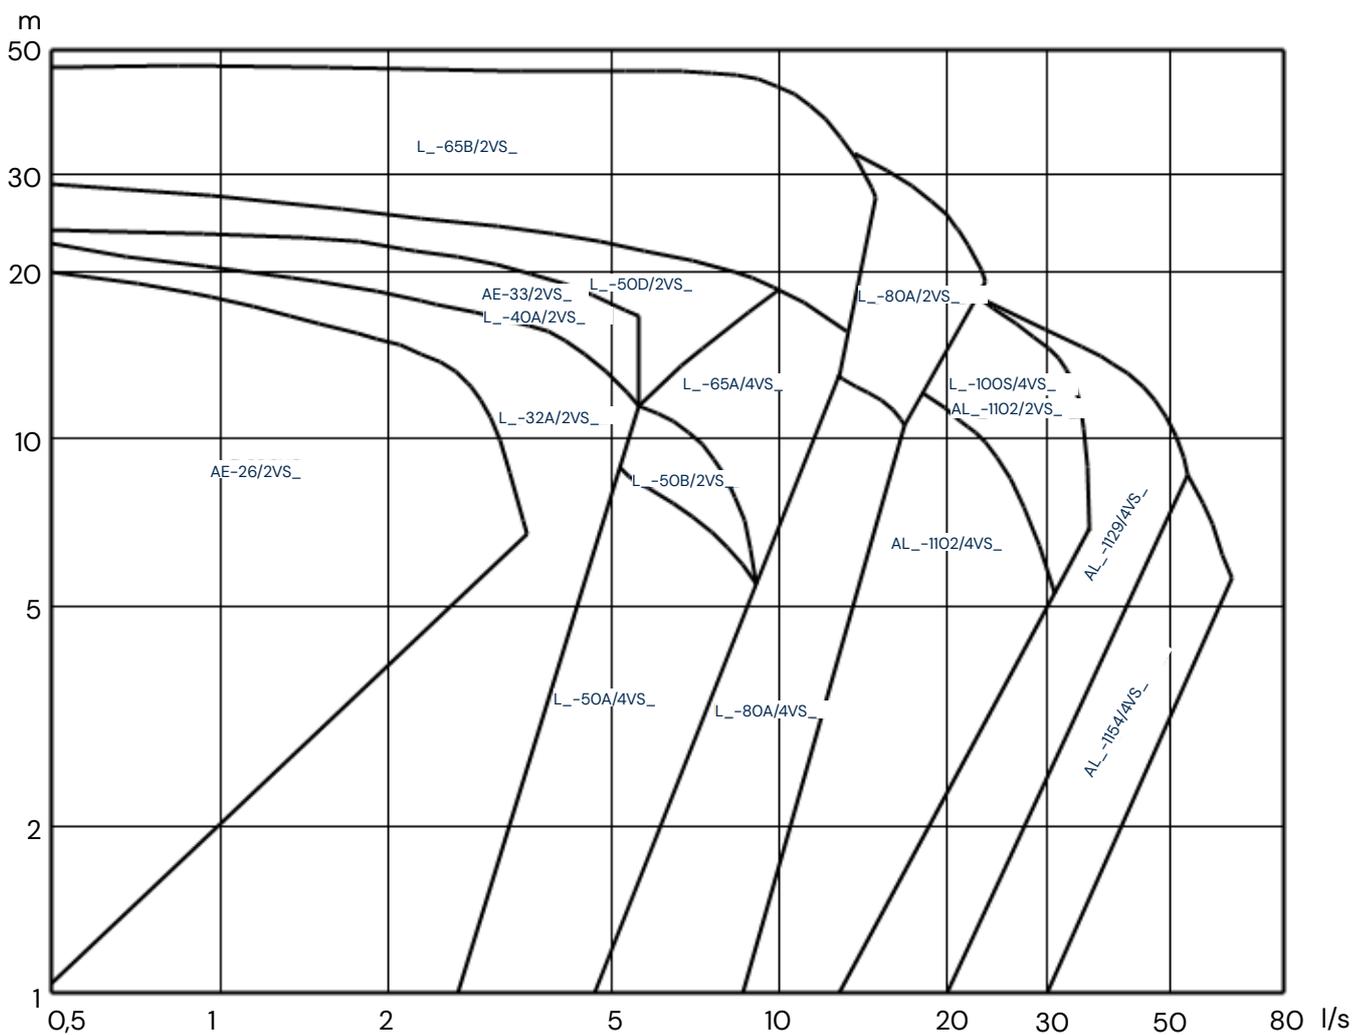

- Bronze SC and VS pumps can be used as domestic hot water, circulation, pressure boosting and transfer pumps for clean, oxygen-rich and some slightly aggressive liquids.
- Stainless steel AISI316 SC and VS pumps can be used as circulation, pressure boosting and transfer pumps for clean and aggressive liquids.

The most common applications of the SC and VS pump series are heating, ventilation, cooling and heat recovery systems, heat exchangers, pressure boosting, district heating plants, ice rinks, swimming pools, spas and industrial processes.

Quick selection chart SC-pumps

Quick selection chart VS-pumps

Structure

Pump

SC- and VS-series pumps are monoblock-structured centrifugal pumps with a dry asynchronous motor, which fulfill the requirements of EcoDesign –directive. A frequency converter is integrated into the motor. The pump impeller is installed directly onto the shaft of the electric motor (no separate couplings).

Electric motor

The electric motor of SC- and VS-pump is a three-phase Kolmeks asynchronous motor designed specifically for pump use and frequency converter operation, which guarantees high starting torque and low energy consumption. The electric motor is highly efficient and has low noise levels and fulfills the requirements of EcoDesign –directive.

Supply voltage:	SC: 1 x 230 V, 50 Hz VS: 3 x 400 V, 50 Hz
Enclosure class:	IP 54
Insulation class:	F
Duty type:	Continuous duty (S1)
Ambient temperature:	0°C ... +40°C

Connections

Flanged:

The flanges of SC- and VS-pump fit counter-flanges dimensioned according to ISO 7005.

Threaded:

The SC and VS-pump threads are dimensioned according to Standard ISO 228/1.

Seals

The standard shaft seal of an SC- and VS-series pump is a single mechanical seal. The pump housing seal is O-ring or flat gasket. Other seal options are available by request.

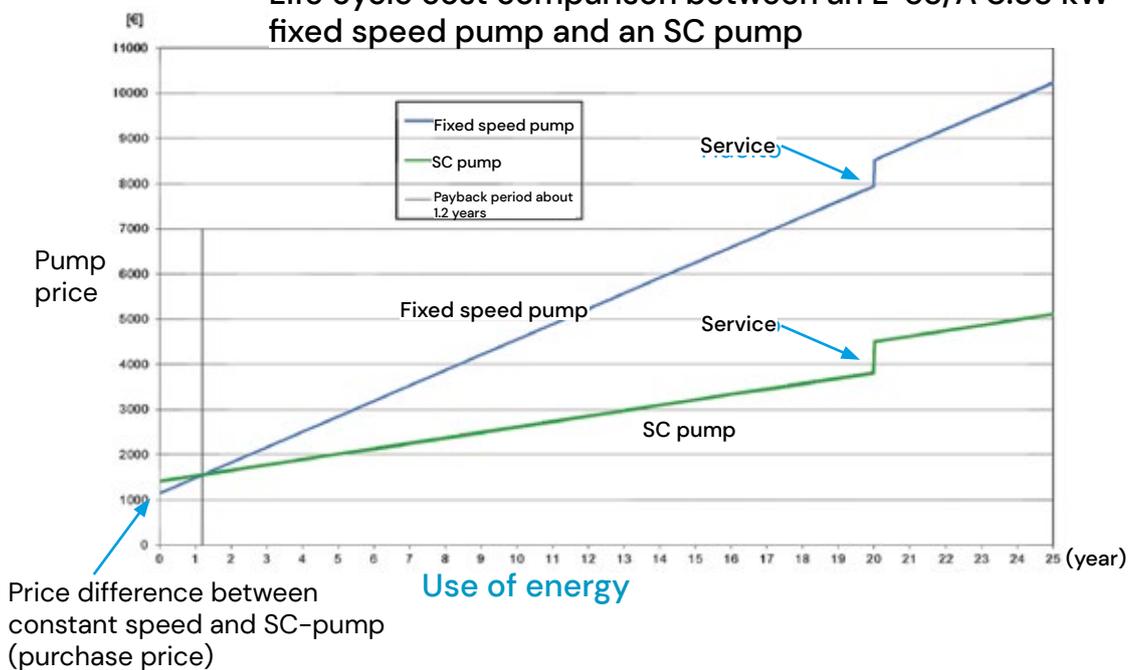

Advantages of selecting an SC or VS pump

- The pump is adjusted manually / automatically adjusts its duty to match the requirements of the system
- The duty point, and therefore the electric power consumption, is determined by actual flow requirements, resulting in reduced running and life cycle costs.
- Depending on pump size, the payback period compared to a fixed speed pump is 0.5–2.5 years (see example).

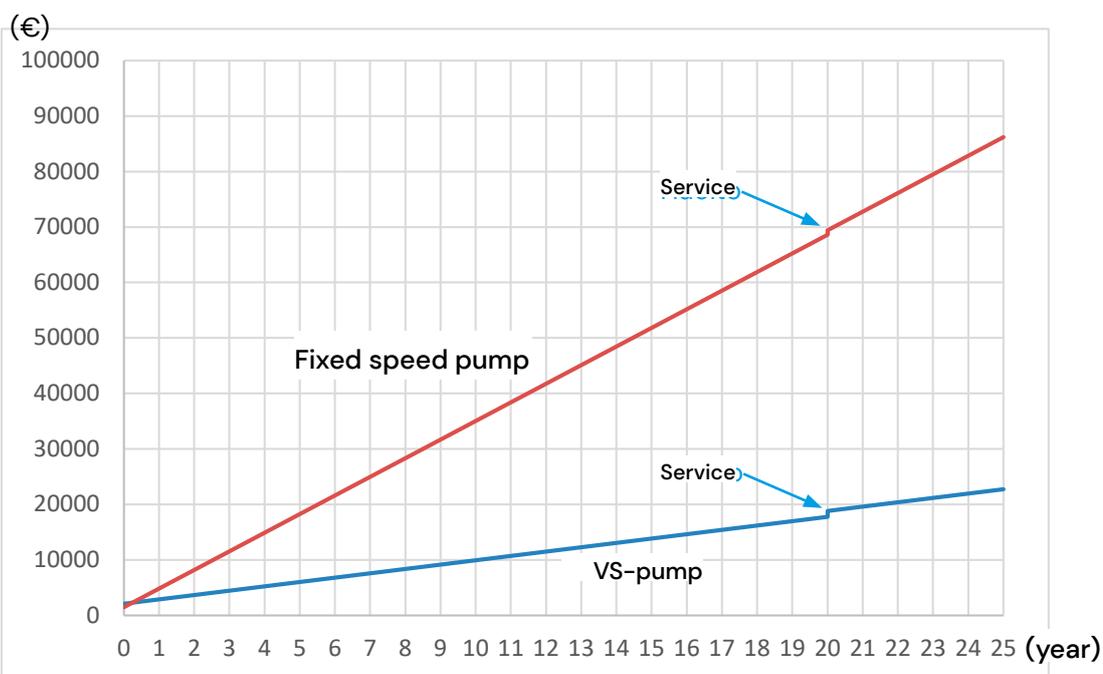

Cost comparison, $Q=6l/s$, $H=35kPa$
L-65A/4 0.55kW fixed speed pump
L-65A/4 SCG 0.55kW with integrated frequency converter

Accumulative cost

Life cycle cost comparison between an L-65/A 0.55 kW fixed speed pump and an SC pump

Cost comparison, $Q=20l/s$, $H=113kPa$
AL-1102/2 Ø128 4kW fixed speed pump
AL-1102/4 VSC Ø181 3kW 60Hz with integrated frequency converter

Kolmeks recommendation for pumps in district heating circulation systems

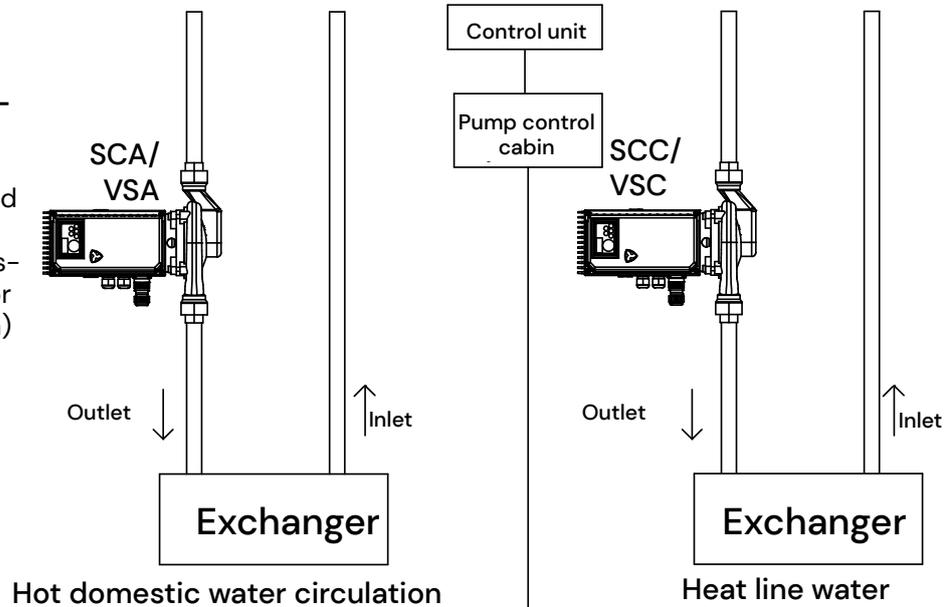

As the payback period for installing a Kolmeks SC variable speed pump is short, Kolmeks recommends the use of variable speed pumps in new systems and the replacement of fixed speed pumps with variable speed pumps in existing systems.

Supply voltage
SC: 1 x 230 V
VS: 3 x 400 V

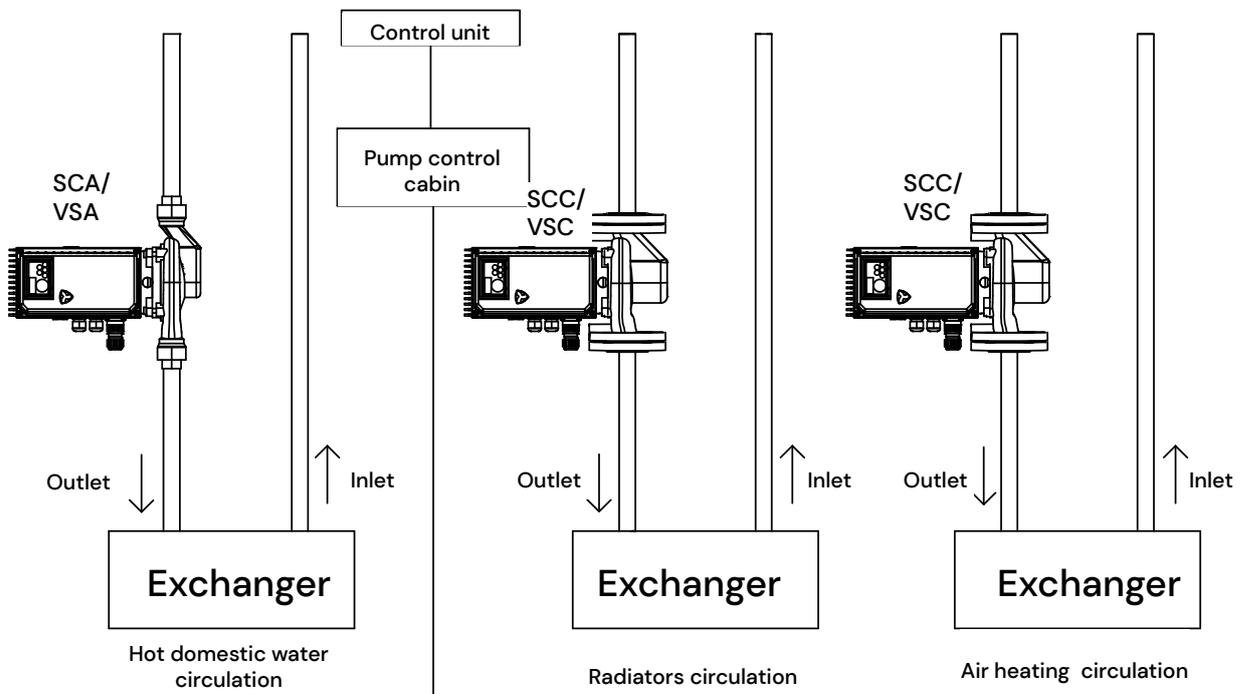

Advantages of SC- and VS-pumps

- Alarms to BMS
- Duty point can be adjusted in one step
- Operates according to system requirements (radiator and air heating circulation)
- Energy savings
- Reliable operation

PN10 = Max. working pressure 10bar, grey cast iron and bronze

PN16 = Max. working pressure 16bar, nodular cast iron and stainless steel

Shaft seal

The standard shaft seal of an VS-series pump is a single mechanical seal. The pump housing seal is O-ring or a gasket. Other seal options are available by request.

Part of single mechanical shaft seal

- 1 Rotating ring
- 2 Stationary ring
- 3 Body/bellows
- 4 Spring
- 5 O-ring

Rating plate information

Rating plate

Additional accessories:

T = Seal for aggressive liquids (external)

H = Flushing

KT = Double mechanical seal

Sn = Non-standard mechanical seal

~~Kn = Non-standard surface treatment~~

Special impeller material:

PM = Bronze

SS = stainless steel AISI316

5) SC = SC frequency converter integrated in pump.

VS = VS frequency converter integrated in pump:

Pump adjustment method
 SCA/VSA, SCB/VSB, SCC/VSC,
 SCD/VSD, SCF/VSF, SCG/VSG,
 SCM/VSM

Pump installation

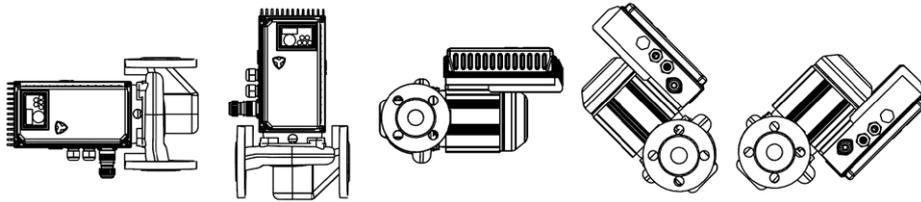

The pump can be installed in the piping without additional support up to 3kW. 4kW and above must be installed with base plate to the vertical position. The position of the motor unit and therefore the location of the frequency converter box can be changed by detaching the motor unit from the pump housing and turning it to the required position, within certain limitations.

Ensure the following when installing the pump:

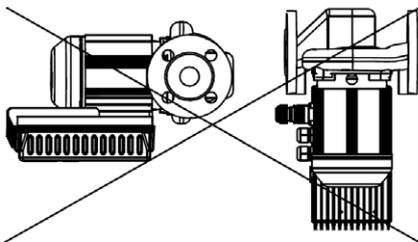

- Enough room for control, service and inspections
- The installation position should be chosen such that the display is readable; a separate control panel can be used if required.
- Possibility to use lifting and transfer devices if required
- Shut-off valves on both sides of the pump
- The pump must be installed in such a position that the frequency converter of the pump is not in the immediate vicinity of a hot pipe.

Operating positions

Permitted operating positions

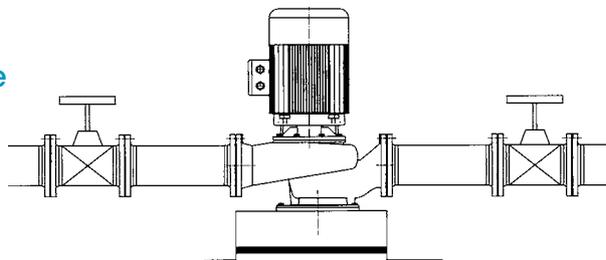

Prohibited operating positions

Recommended general limits without the base

Size	Power
DN 15 ... 50	max. 2,2 kW
DN 65	4 kW
DN 80	4 kW
DN 100	7,5 kW
DN 125	7,5 kW

Large pumps are fastened by their base plate onto a freely moving concrete plinth, which is to be separated from the floor by a 20-mm thick rubber or cork mat. The weight of the concrete base must be about 1.5 times the weight of the pump.

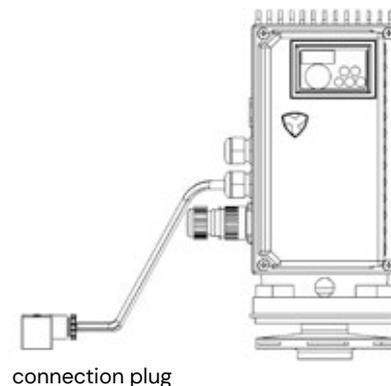

Drive unit

Exchange unit SCA/VSB-, SCC/VSC-, SCD/VSD- and SCF/VSF-pump

The complete pump motor unit is a new spare motor unit which includes:

- Electric motor
- Frequency converter
- Transmitter quick connection plug with wires
- Sealing flange
- Impeller
- Seals

When replacing the drive unit, no piping or electrical work is required, as there is no need to detach the pump housing, and the power supply is connected using a quick connection plug. There is also no need to detach the transmitter or its tubes. Only the cap screw of the plug connector at the top of the transmitter is opened, which enables the plug connector and its wiring to be pulled out. In the new drive unit, the connection plug is pre-wired, which allows quick replacement of the transmitter electrical connection.

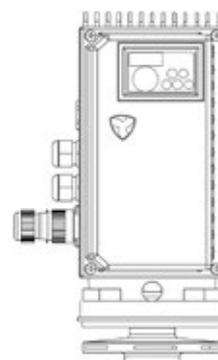

Drive unit SCA/VSA- and SCG/VSG-pump

The complete pump motor unit is a new spare motor unit which includes:

- Electric motor
- Frequency converter
- Sealing flange
- Impeller
- Seals

When the drive unit is changed, there is no need for piping work or electrical installations. When changing the VS –drive unit, electrical wiring installation is needed due to fixed mains supply connection.

Control methods and control connections

SC pump I/Os (inputs and outputs)

Terminal 4	Programmable 4–20 mA, 0–5 VDC, 0–10 VDC analog input (voltage/current selection switch)
Terminal 2	Programmable 0–10 VDC, 0–5 VDC analog input
Terminals STF, STR, RH, RM, RL	Programmable digital inputs
Terminal PC	24 VDC voltage supply for digital inputs and feedback transmitter (max. 100 mA)
Terminal 10	5 VDC voltage supply for potentiometer
Terminal 5	Signal ground
AM / 5	Programmable analog output
Relay output, Terminals A,B, C	Fault indication (programmable relay output), potential free change-over contacts max. 230 VAC / 0.3 A, cos φ 0.4, max. 30 VAC / 0.3 A
Transistor output, Terminals RUN, SE	Load 27 V / 0.1 A, voltage loss 3.4 V

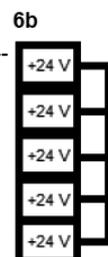

Terminal factory settings

Terminal 4	Programmed as feedback input 4–20 mA or not in use depending on the pump control method
Terminal 2	0–10 VDC direct speed reference or controller reference depending on control method used, or not in use.
Terminal STF	Jumper between terminals PC–STF open/closed = pump off/on (In SCB- and SCC –pumps the external switch for pump on/off is connected between terminal 8 of the additional measurement card and terminal STF.)
Terminal STR	Not in use
Terminal RH	Dry running protection in the SCD version
Terminal RM	Jogging operation. PC – RM open/closed = normal operation / runs forced at 40 Hz frequency.
AM / 5	Analog output 0–10 VDC. SCCVAK (direct speed reference from automation) and in SCG versions programmed as frequency. SCB, SCC, SCCVAK (differential pressure reference from automation), in SCD and SCF version programmed as feedback.
Relay output, Terminals A,B ja C	The relay output is programmed with fault information. The relay draws: Terminals A and C connected, when the pump runs or voltage is connected to it. Terminals B and C connected, when the device is in fault mode or dead.

VS-pump terminal factory settings

Terminal	Signal	Kolmeks Factory Default
A RS485	Serial -	
B RS485	Serial +	
1 +10Vref	+10 V reference voltage	
2 AI1+	Analogue input 1 voltage or current	A-, B- and C-versions: Current (SW 2 + P3.1) D- and G-versions: Voltage (SW2 + P.3.1)
3 AI1-/GND	AI1-	
6 24Vout	+24 V, loadability 100mA	
7 DIN COM	Digital input common	
8 DI1	Digital input 1	Run / Stop (P4.1 - P4.18) *
9 DI2	Digital input 2	PID-Controller (P4.1 - P4.18) *
10 DI3	Digital input 3	Preset speed, 40 Hz (P4.1 - P4.18) *
4 AI2+	Analogue input 2 voltage or current	Current (SW 3 + P3.5)
5 AI2-/GND	AI2-	
13 DO1-	Digital output -	
14 DI4	Digital input 4	Not in use(P4.1 - P4.18) *
15 DI5	Digital input 5	Fault reset (P4.1 - P4.18) *
16 DI6	Digital input 6	NC External fault (P4.1 - P4.18) *
18 AO1+	Analogue output	Output Frequency 0 - fmax , 0 - 10V (P6.1)
20 DO1+	Digital output +	Not in use

*) Parameter group 4 operations are activated by choosing digital inputs with parameters 4.1 - 4.18

22	RO1/2		Run
23	RO1/3		
24	RO2/1		Fault
25	RO2/2		
26	RO2/3		

Dip switch	Operation	Factory Default
SW 1	Digital input COM (terminal 7) can be isolated from GND by setting SW1 to position "1"	SW1 = 0
SW 2	Analogue input 1 operation mode selection either to current or voltage. When the switch is in position "0", AI1 operates as current input (0/4-20 mA). When the switch is in position "1", AI1 operates as voltage input(0-10V)	SW2 = 0 A,- B- and C-versions SW2 = 1 D- and G-versions
SW 3	Analogue input 2 operation mode selection either to current or voltage. When the switch is in position "0", AI2 operates as current input (0/4-20 mA). When the switch is in position "1", AI2 operates as voltage input(0-10V)	SW3 = 0
SW 4	The Switch SW4 is related to RS485 connection, It's used for bus termination. The bus termination must be set to the first an last device on the network. The switch SW4 in position "0" means that termination resistance is connected and the termination of the bus has been set. If the VS-pump is the last device on the net, this switch must be set to "0" position.	SW4 = 0

SCA- / VSA-pump: Direct speed reference by potentiometer

Applications

For systems with no continuous automatic adjustment requirement and a constant duty point, such as domestic hot water circulation systems, for example.

Accessories

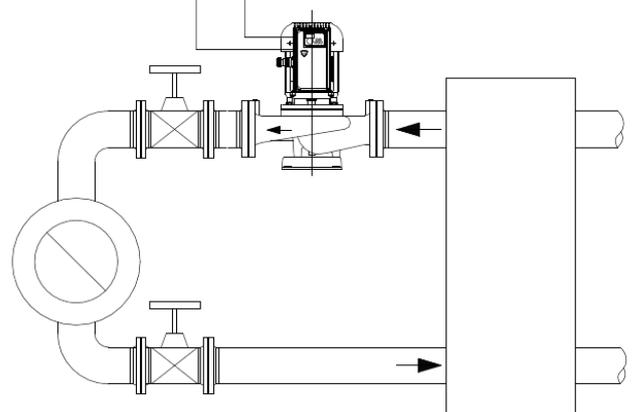

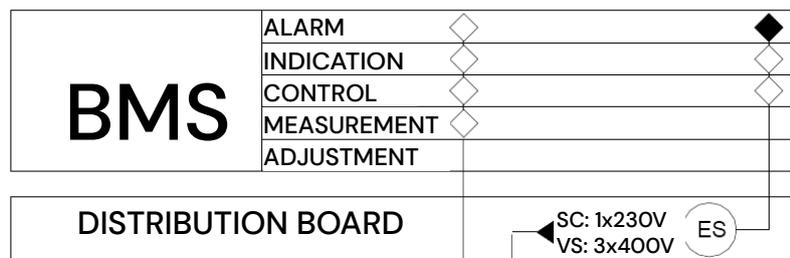

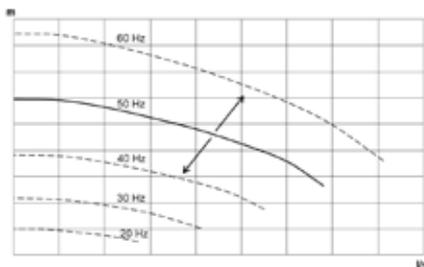

Pump and frequency converter.

Operating principle

The rotation speed of the pump is set in one step using the buttons on the frequency converter when commissioning the pump.

Pump curve

The pump QH curve equals the QH curve of a standard speed pump.

SCB- / VSB-pump: Constant differential pressure across pump

Applications

For circulation systems where flow rates vary and the majority of pressure loss is created at consumption targets. For example, heating and cooling systems and pressure boosting in parallel circulation systems.

Accessories

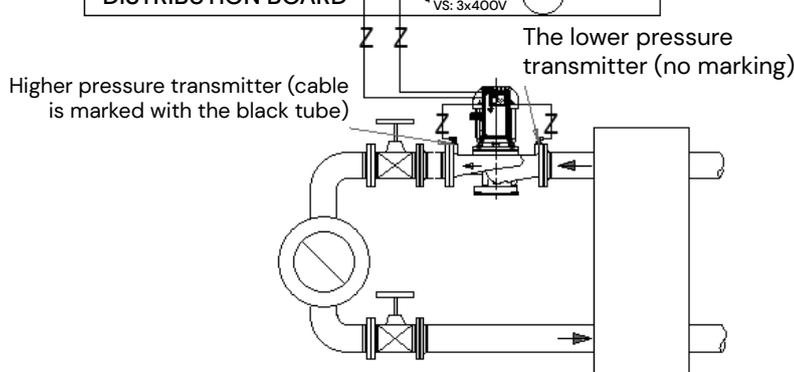

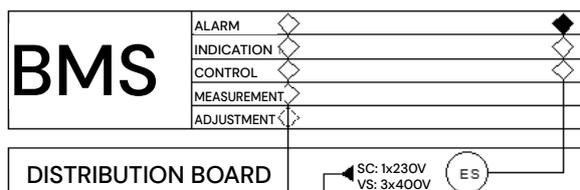

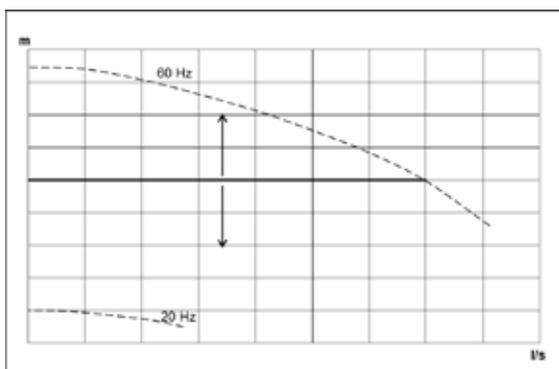

Pump, frequency converter, differential pressure transmitter and measurement pipes installed in the suction and discharge flanges of the pump. The higher pressure transmitter cable is marked with the black tube. The lower pressure transmitter has no markings.

Operating principle and system adjustment

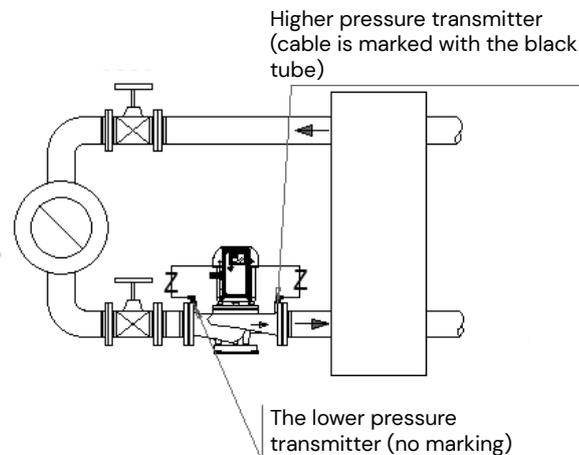

The differential constant pressure is maintained between the pump flanges, which is set up with the buttons of the frequency converter.

Pump curve

The QH curve of the pump is horizontal, which is applicable for circulation systems where the pressure loss of the heat source is low in relation to the total pressure loss.

PUMP IN SUPPLY

PUMP IN RETURN

SCC- / VSC-pump: Constant differential pressure in piping

Applications

For circulation systems where flow rates vary significantly and the majority of pressure loss is created at consumption targets. For example, heating and cooling systems and pressure boosting in parallel circulation systems.

Accessories

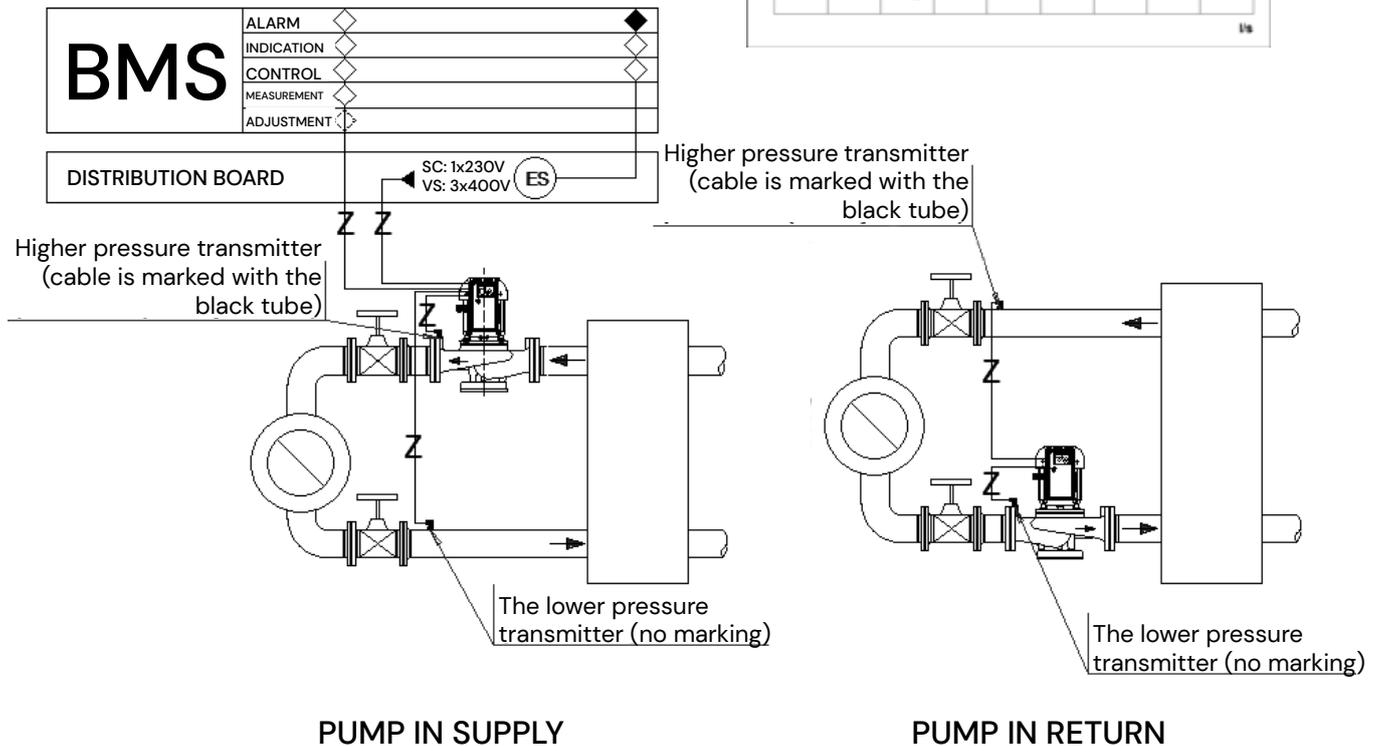

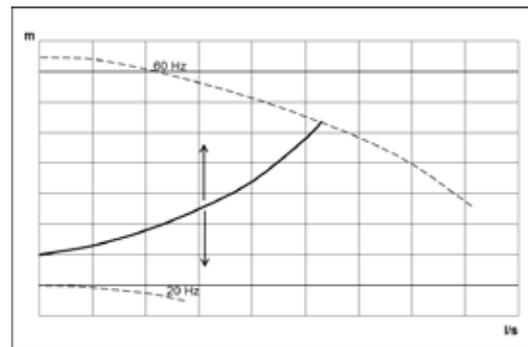

Pump, frequency converter, differential pressure transmitter with pipes, one of which is installed in the suction or pressure flange in the pump and the other in the system's inlet or outlet pipe. The higher pressure transmitter cable is marked with the black tube. The lower pressure transmitter has no markings.

Operating principle and system adjustment

The differential constant pressure is maintained between the supply and return pipes, which is set up with the buttons of the frequency converter

Pump curve

The pump QH curve is automatically square. The shape of the QH curve depends on the relation of the heat source pressure loss to the total pressure loss of the circulation system. The larger the share of the heat exchanger pressure loss is in relation to the circulation system's total pressure loss, the steeper the QH curve is.

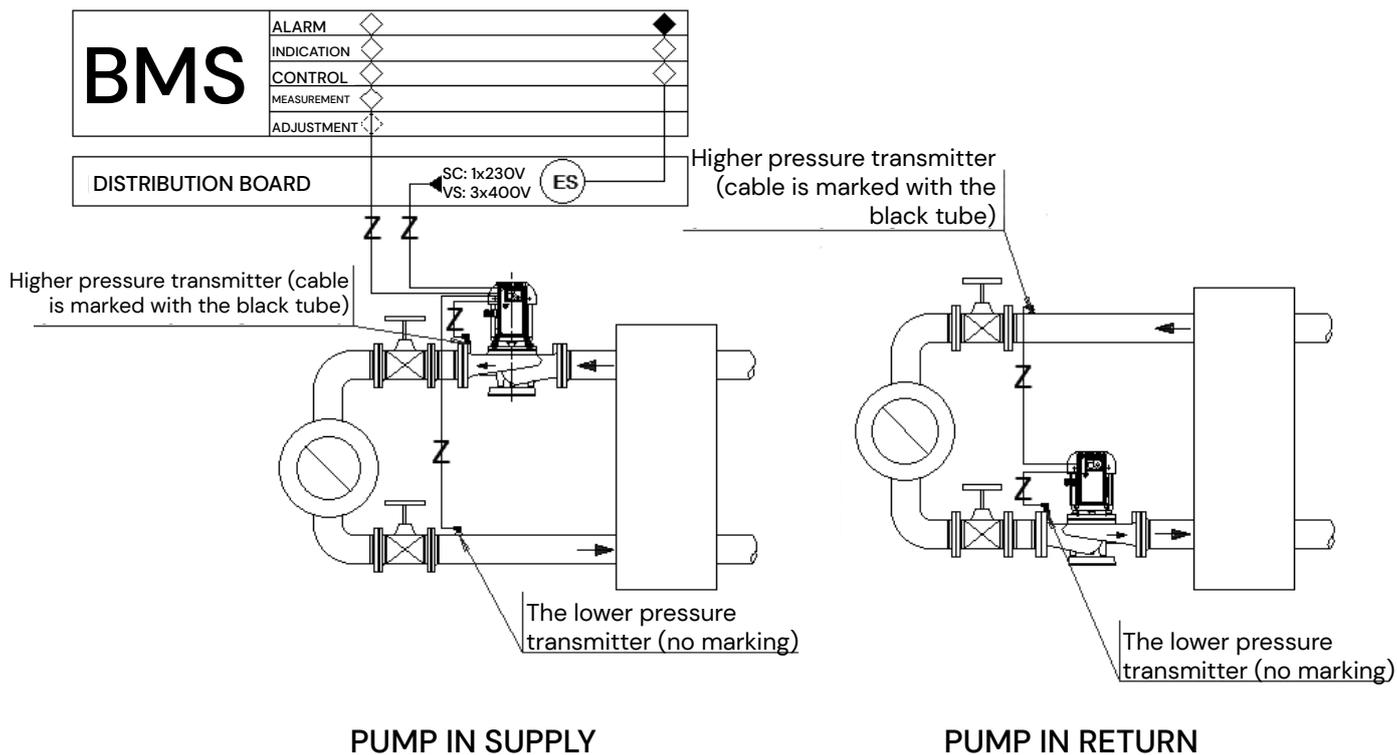

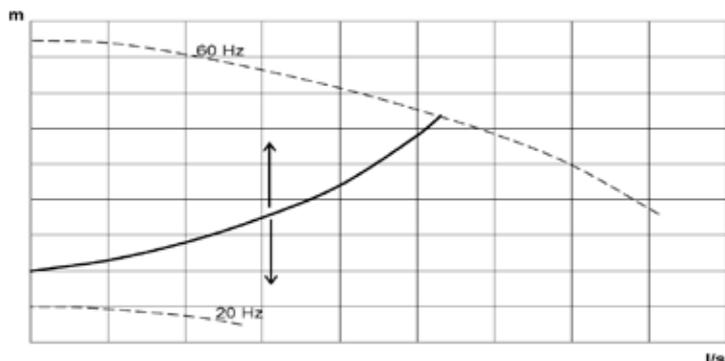

SCCVAK- / VSCVAK-pump: Constant differential pressure in piping by frequency converter PI-controller

Operating principle

Constant differential pressure is maintained over the inlet and outlet line of the system by setting it in the BMS (differential pressure reference value as voltage current signal 0–10 V). These connections and operation are the same as for the SCC- / VSC-pump.

NOTE! If the BMS is not operational when pumping is required, set the differential pressure with the buttons of the frequency converter.

SCD / VSD-pump: Constant pressure in discharge flange (pressure boosting)

Applications

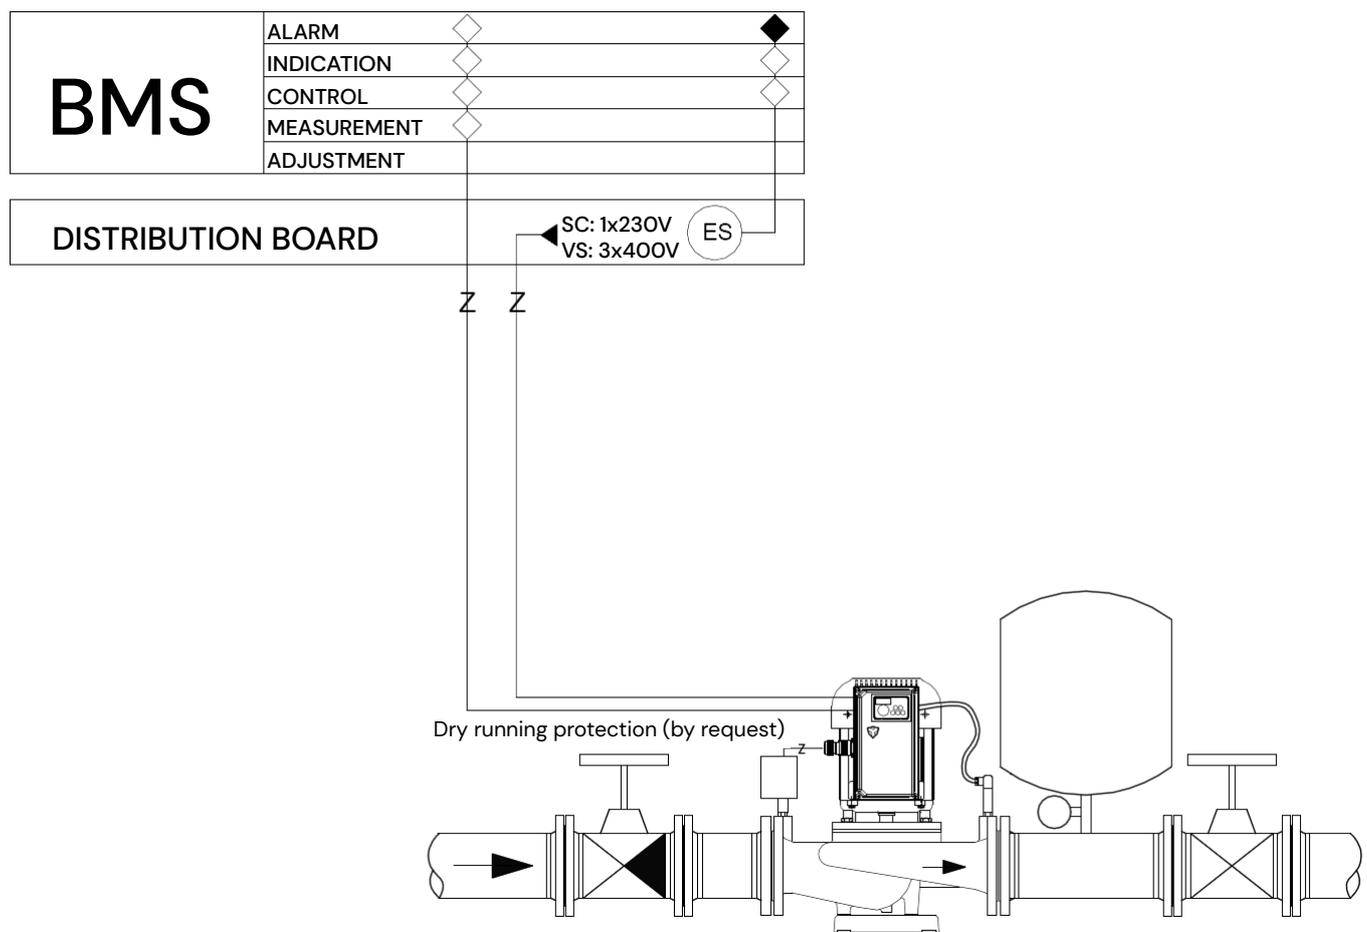

For pressure boosting and other open systems which require a constant pressure.

Accessories

Pump, frequency converter and pressure transmitter which is installed either on the pump discharge flange or consumption point.

Operating principle

The constant discharge pressure is maintained, which is set up with the buttons of the frequency converter

SCF- / VSF-pump: Constant temperature

Applications

For heating or cooling systems which maintain constant temperature by adjusting the flow rate.

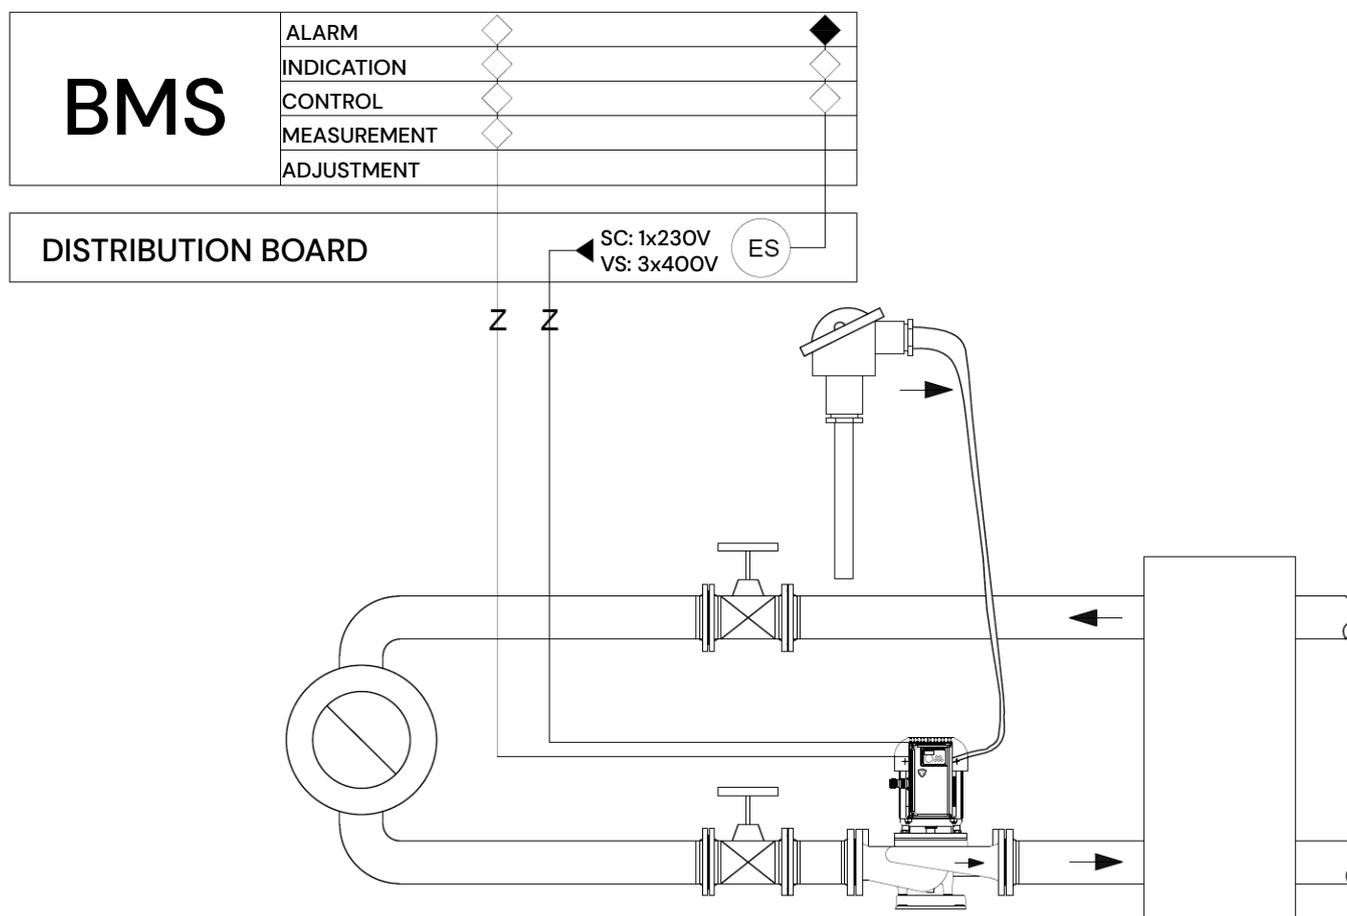

Accessories

Pump, frequency converter and temperature transmitter.

Operating principle

The constant temperature is maintained, which is set up with the buttons of the frequency converter.

NOTE! Regulation mode is needed when ordering the pump. NORMAL: Speed decreases when feedback higher than reference (heating system). INVERSE: Speed increases when feedback higher than reference (cooling system).

SCG- / VSG-pump: Pump speed controlled by external automation

For systems with varying flow rates and/or in which the flow rate is adjusted using the pump. The pump is controlled centrally or by a separate controller.

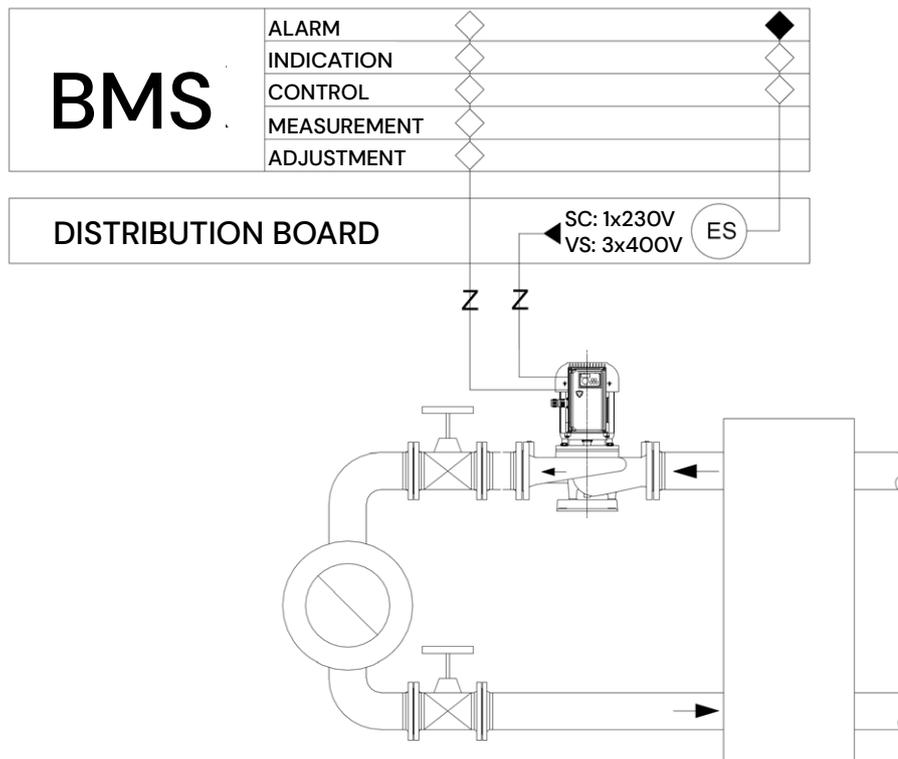

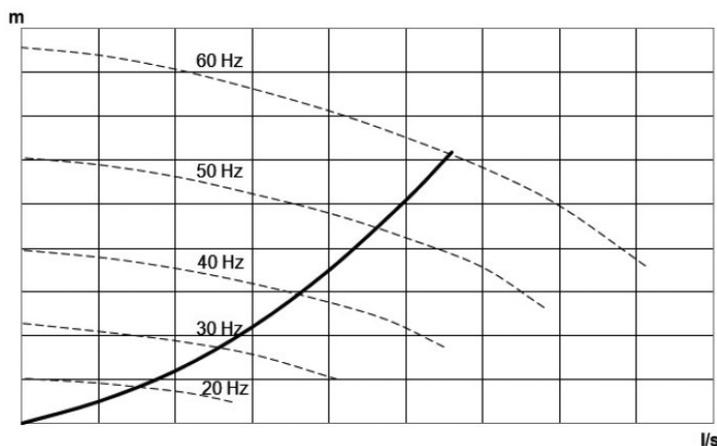

Accessories

Pump and frequency converter.

Operating principle

The pump is given a direct speed reference externally e.g. from the BMS, a separate controller, process control, etc.

NOTE! If the BMS is not operational when pumping is required, the standard speed of the pump can be set in the same way as for an SCA-/VSA- pump.

SCM- / VSM-pump: Automation controlled pump with MODBUS RTU bus

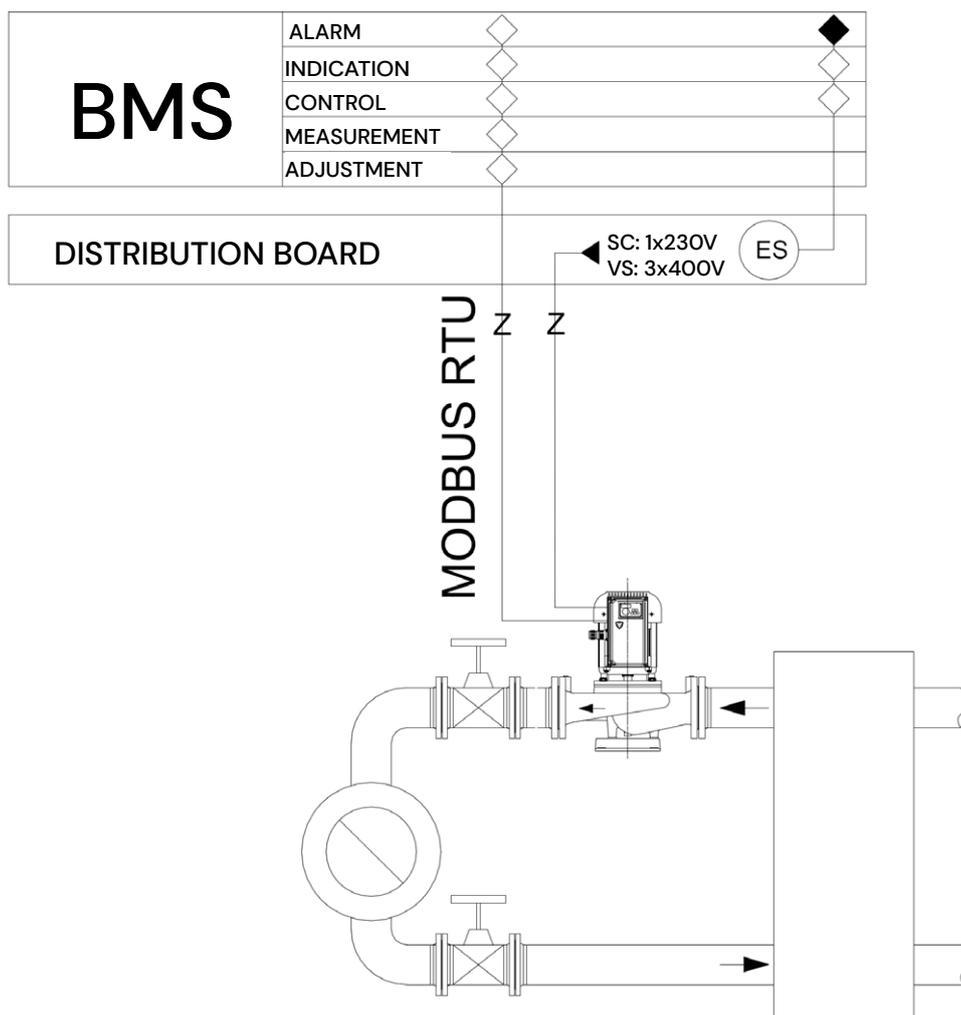

For systems with varying flow rates and/or in which the flow rate is adjusted by the pump. The pump is controlled centrally or by a separate controller.

Accessories

Pump and frequency converter.

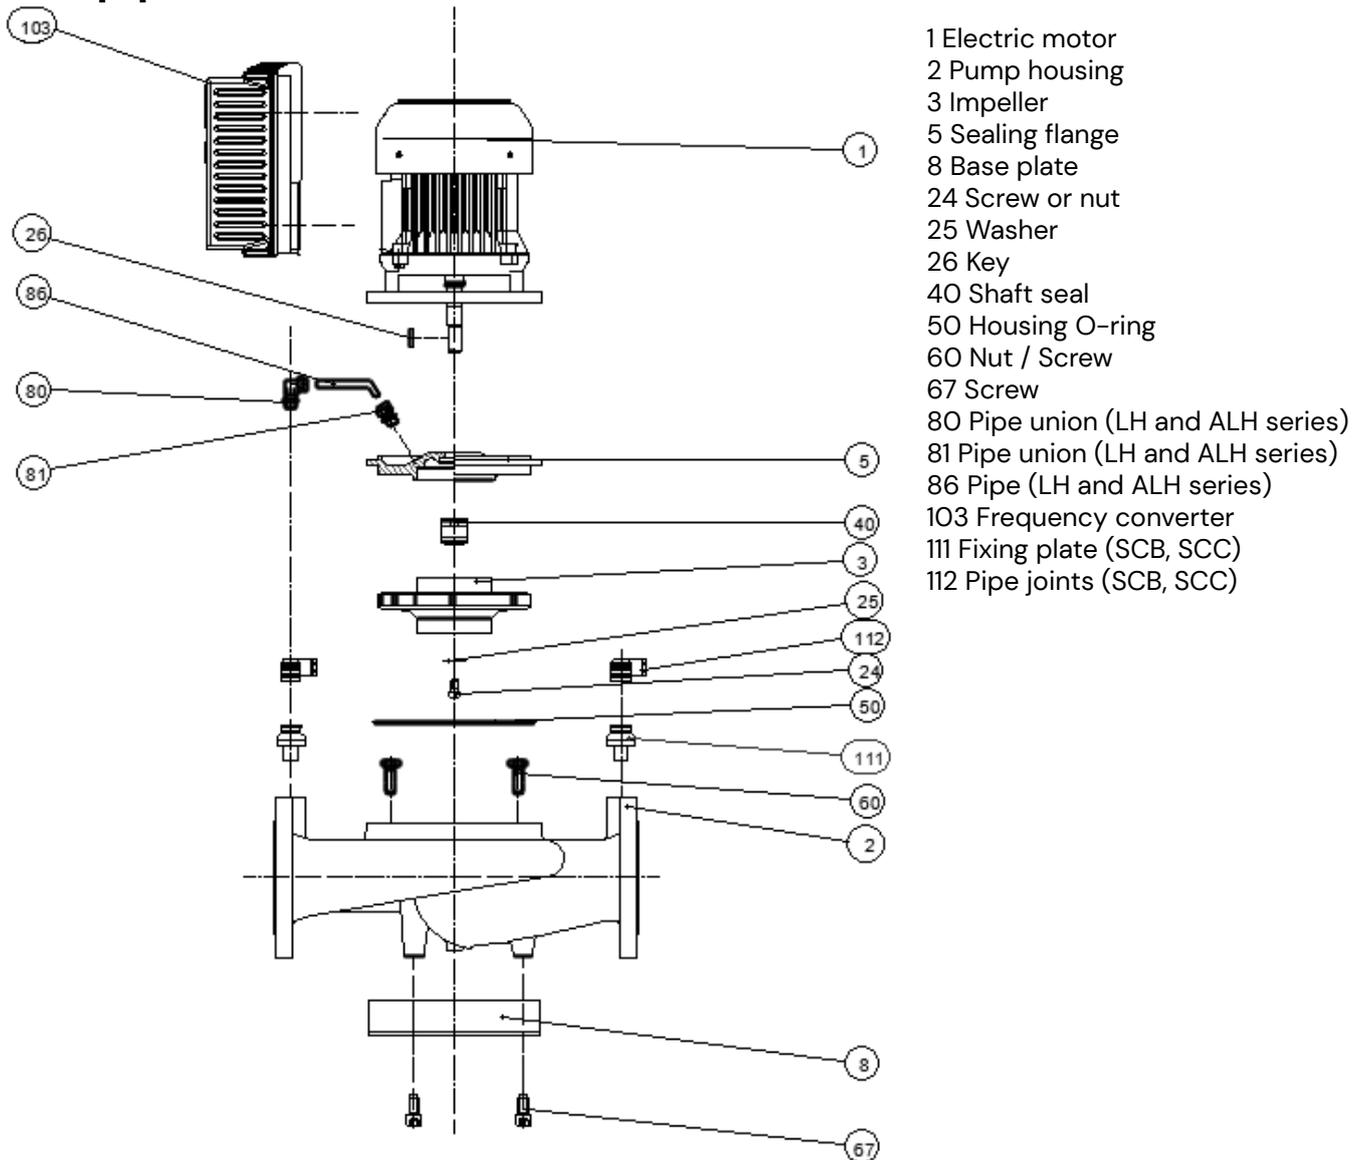

Operating principle

The adjustment, control, measurement, indication and alarms of the pump frequency converter is carried out externally using building automation, process control, or by means of MODBUS RTU bus functions.

NOTE! The following serial bus connection option cards are available for VS –pumps by request: Lonworks, Profibus DP, CANopen, Devicenet MODBUS TCP, Profinet ja Ethernet IP.

Pump parts

When ordering spare parts, please state the pump type, serial number, duty point, impeller size, electric motor type and power. These can be found on the rating plate.

TECHNICAL INFORMATION

CIRCULATING PUMPS TO THE POWER PLANTS AND PRIMARY SIDE OF DISTRICT HEATING SYSTEMS, INLINE

INLINE PUMPS WITH INTEGRATED NC FREQUENCY CONVERTER,
1,1 – 3kW 1X230V
4 – 45kW 3X400V

General technical data

NC series of Kolmek's circulation pumps and variable speed controlled centrifugal pumps with integrated frequency converter.

Applications

NC series pumps can be used as circulation, pressure boosting and transfer pumps for clean liquids.

- Bronze NC pumps can be used as domestic hot water, circulation, pressure boosting and transfer pumps for clean, oxygen-rich and some slightly aggressive liquids.
- Stainless steel AISI316 NC pumps can be used as circulation, pressure boosting and transfer pumps for clean and aggressive liquids.

The most common applications of the NC pump series are heating, ventilation, cooling and heat recovery systems, heat exchangers, pressure boosting, district heating plants, ice rinks, swimming pools, spas and industrial processes.

Structure

Pump

NC series pumps are monoblock-structured centrifugal pumps with a dry asynchronous motor, which fulfill the requirements of EcoDesign -directive. A frequency converter is integrated into the motor. The pump impeller is installed directly onto the shaft of the electric motor (no separate couplings).

Electric motor

The electric motor of an NC pump is a three-phase Kolmek's asynchronous motor designed specifically for pump use and frequency converter operation, which guarantees high starting torque and low energy consumption. The electric motor is highly efficient and has low noise levels. Moottori täyttää EcoDesign-direktiivin vaatimukset.

Supply voltage:	1,1 – 3kW 1 x 230 V, 50 Hz 4 – 45kW 3 x 400 V, 50 Hz
Enclosure class:	IP 54
Insulation class:	F
Duty type:	Continuous Duty (S1)
Ambient temperature:	0°C ... +40°C

Connections

Flanged:

The flanges of NC pump fit counter-flanges dimensioned according to ISO 7005.

Threaded:

The NC pump threads are dimensioned according to Standard ISO 228/1.

Seals

The standard shaft seal of an NC series pump is a single mechanical seal. The pump housing seal is O-ring or flat gasket.

Other seal options are available by request.

Other Technical Data

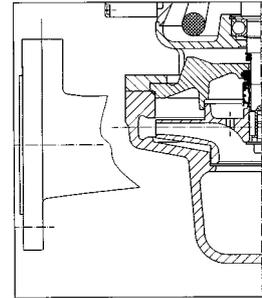

See the section Technical Data of SC- and VS -pumps.

Seal structure alternatives

Standard structure

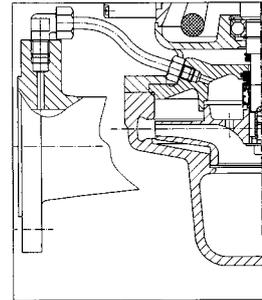

- Single mechanical seal
- Max. operating temperature +120°C.

The standard-construction shaft seal can also be used for water-glycol mixtures and most other indirect refrigeration systems. The recommended glycol is propylene glycol with a concentration of up to 50%. Most often, a concentration of 30–40% is adequate.

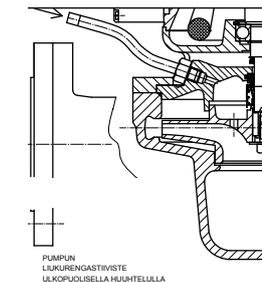

Internal flushing

- Single mechanical seal
- Recirculation from the discharge flange of the pump to the seal chamber which flushes the seal
- Max. +150°C water
- Available for flange sizes DN50 ... DN300. . This is indicated with an additional marking 'H' in the pump type e.g. LS-65B/4H.

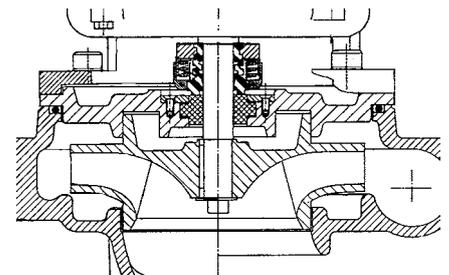

External flushing

- Single mechanical seal
- A pipe from an external source plugged to the seal chamber, which makes it possible to flush the seal with external pressure if required
- Available for pumps in flange sizes DN 50–300 pumps
- Crystallising and accumulative liquids

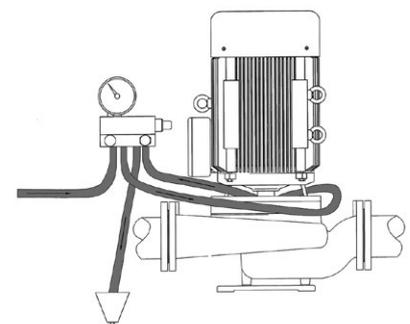

External seal

- Externally-mounted single mechanical Teflon bellows
- Available for flange sizes DN 65–300 ALS pumps
- Extremely corrosive liquids, e.g. sulfuric acid
- Marking 'T' in the pump type e.g. ALS-1065/4T
- NOTE! Maximum working pressure 10 bar

Double mechanical seal system (cartridge)

- Two opposing seals with sealing liquid brought from outside (circulation). The pressure of the liquid can be lower or higher than that of the liquid being pumped
- Available for flange sizes DN 65–300 pumps
- Max. operating temperature +180°C for water
- Requires a separate seal water monitoring unit (available from Kolmeks)
- Marking 'KT' in the pump type e.g. ALS-1154/4KT
- Hot, crystallizing and accumulative liquids
